The domain Users are just members of the Users group. If you want to make them Power Users open the Computer Management applet, select Local users & groups -> groups -> Power Users and add to the list of members the Domain Users group for your domain.

> Also, is a Domain Admin given Administrative access when he/she logs on to the same box?

yes, because when you join a computer to a domain the Domain Admins group is made member of the Local Administrators group. Any domain admin becomes therefore an admin on the computer.

logs onto a XP Pro machine. And if possible can I give all Domain Users  
Power Users Access, if yes how so? Also, is a Domain Admin given  
Administrative access when he/she logs on to the same box?
