I sincerely appreciate you response and will keep it for future reference. Carey Frisch solved my present problem. Still I thank you for offering help.

>*Your problem might be that if ACPI is not enabled in the BIOS settings of the PC then Power Management functions will not be enabled under Windows. If you want to read about ACPI & Power Management for Windows, click on Help in the Start Menu and type in ACPI. Under Windows 2000 ACPI needed to be enabled PRIOR to installation of the software. I'm not sure if this is still the case with Windows XP. During the Install process Windows 2000 would install a different HAL (Hardware Abstraction Layer) for the OS to allow it to control power functions. This could not be changed after installation.*

>

>*To see if Windows is installed with ACPI support you can either Right click on "My Computer" to display "System Properties" or go into the Control Panel and click on the System icon. On the "System Properties" menu click on the Hardware tab at the top. On the Hardware page click on the Device Manager button. This will display all the hardware devices in your PC. Click on the +plus sign next to the Computer Icon. If it shows Advanced Configuration & Power Interface (ACPI) PC then Windows was installed with ACPI support. If this is not shown then this is probably your problem.*
