Hello, I have Windows XP Pro when I wanted to reinstall Windows. Everything went smoothly when it copied files to install Windows, but when setup started the following errors occurred.

1. Setup lagged at 39 min., but wasn't frozen.
2. Then, after about 20 minutes an error box came up. Then, it displayed the setuperr log file.

Does anyone know how to fix these errors during setup?

The following is the exact information contained in the error log:

Thank you for taking your time to help me.

Error:

Setup encountered an error while trying to set system security.

An extended error has occurred.

Fatal Error:

One of the components that Windows needs to continue setup could not be installed.

The operation was canceled by the user.

Error:

Setup encountered an error while trying to set system security.

An extended error has occurred.
