Hi all,

I had trouble try to repair my Windows XP pro.

Yesterday, I had the problem with my comp. It just hung while I was trying to turn it off.

Then, I tried to restart the machine, and it said the file hal.dll is missing or corrupted. So.. I copied this file from another machine and put to system32 folder, and it still couldn't boot.

So, I decided to use the CD to re-install using repair mode.

Then, the machine can boot. However, after the black screen with XP logo, it went to blue screen with the words "setup is being restarted..." then restarted again and again..

What does this mean?? and how to fix this thing? and what is the hal.dll file for??

sorry for a bunch of questions. Thanks a million guys...
