Hi,

I need to implement a solution whereby our remote users are restricted to what they can and can't do on their laptops. I'd like to do this via a group policy on our Win2003 server. Basically, all remote users will be connecting to the server via VPN. Once connected they will sync their Outlook OST and also sync their Offline Files. I'd like the policy to reflect this and also to make it impossible for them to install 3rd party software or make any changes to system settings. Can anyone point me in the direction of some relevant info or maybe even some policy templates to achieve this.

Many thanks,
Matt
