I know XP and W2K to be nearly identical with these things. I stuck phony scripts in the %windir%\System32\GroupPolicy\Machine\Scripts\Startup directory and they were displayed in the GPO tool but at a quick glance I couldn't readily see where it would be changed to the other folder. So I am thinking that my answer may be incorrect but I'm not sure?

John,

I guess it doesn't matter much. On my computers the logon script is in %Systemroot%\System32\Repl\Import\Scripts, but the installation has been upgraded since Windows 3.0 (if not 2.1 :-), so I can't be sure whether they should be in the other folder in newer installations.

It is possible that the only thing that matters is that the scripts are in the NETLOGON share, because they may always be started from there, but I cannot verify that.

Hans-Georg
