I finally got it to work– This is what I had to do. I went to Novell's website, downloaded for free the latest Novell client (ver 4.91), installed it, and then had to boot into safe mode to uninstall it. After that I was able to log into my system and do the upgrade. The uninstall must have finally wiped away any of the Client32 that was sticking around. Hope this helps someone else with this same problem, and thanks to all that tried to help.

or more similar in these results:

<http://search.yahoo.com/search?ei=UTF-8&fr=yfp-t-501&cop=mss&p=remove+nwgina&x=0&y=0>

You may also try the Novell site, they have user forums there, other Novell users have probably dealt with this before.

I have only one Local Area Connection and it only uses TCPIP no IPX. I even removed it and rebooted just to make sure it was not still somehow attached and still nothing. I have also searched Windows Explorer and the registry for Client32 and Novell and Netware and deleted anything I could find. Still no success. I tried Andrews idea also, of scrolling through the services and the

only 2 I see related to Netware are nwlkflt and nwlkfwd and both are set to manual and will not let me disable them. So I am still stuck. I hate having to wipe it out but I may end up going that route.

Did you verify all your Network Connections to make sure that it wasn't present on any of them?

Windows 2000 upgrade to XP errors out with Novell Client 32 Incompatibility. Problem is – I have uninstalled the Novell client years ago. I ran unc32.exe to try to clean it out of the system, and I still can't get the upgrade to run. I do not want to wipe out this laptop with a fresh install of XP I want to upgrade. But I am having this issue. Anyone know how to get around it?
