I was having this issue also. The problem ended up being in the local security policy settings. Check this setting from the Administrative Tools > Local Security Policy applet:

Security Settings > Local Policies > User Rights Assignments > Impersonate a client after authentication

If the .NET Framework is installed, you should have the following listings:

<LOCALMACHINE>\ASPNET, Administrators, SERVICE

If these rights aren't setup properly, you can't access WMI from a remote workstation.
