Hi everyone,

I have the following messages in WMI Control Properties:

```
Failed to initialize all required WMI classes
Win32_Processor: Interface: Class not registered
Win32_WMISetting: Successful
Security Information: Successful
Win32_OperatingSystem: Interface: Class not registered
```

I tried to google for some hints to resolve this problem, but I have only found some unregistration/re-registration procedure which didn't worked out.

I am not a professional script writer and I am not very familiar with setting up the environment in which they run. Could you please give me some hints how to resolve this problem?

The system is Windows 2003 SP1. I attach this tiny script I wanted to execute and which fails with the error message:

```
ActiveX component can't create object
800A01AD
Microsoft VBScript runtime error
```

This script is supposed to close all instances of Notepad.

```
strComputer = "."
Set objWMIService = GetObject("winmgmts:" &
"{impersonationLevel=impersonate}!\\" & strComputer & "\root\cimv2")
Set colProcessList = objWMIService.ExecQuery("Select * from Win32_Process
```

Failed to initialize all required WMI classes

```
Where Name = 'notepad.exe')  
For Each objProcess in colProcessList  
objProcess.Terminate()  
Next
```

I would greatly appreciate any help or suggestion how to make this script alive.

Thank you in advance,
geos
