I have used pcAnywhere for years but now have a new computer and can't get it to work correctly. My desktop PC is set up

as

a host. If I attempt a connection while out of town I can never get a connection – "cannot attach to this device" or something similar.

I notice that when I'm home and bring the PC out of standby

by

moving the mouse that the LAN connection is down and takes a couple of seconds to reconnect. This may be the problem. I have unchecked a setting that allows Windows to turn off

this

device to save power but it still disconnects when in

standby.

Also, a tracert from a remote location fails to get all the way to the computer.

Any idea on this? Thanks

Re: PCanywhere won't work if PC in standby mode

Look at the Network card properties (Control panel: system:

device

manager) . If there is a Power tab, look on it for a tick

next to

'allow ..to turn off to save power'. remove the tick.

Apply.

See if that helps.

Thanks, but I've already tried that and seems to make no difference. It's a Realtech card.
