I have three computers on my lan. Two winxp and 1 win98. the win98 machine is a laptop old Thinkpad and it up till recently worked great as a client on the winxp remote system

The laptop had a recent crash I have now reinstalled everything and can not no matter what I try get the win98 to log into the winxp as the remote desktop client.

I can get either of the winxp machine to log into each other as remote desktop but not the win98 machine I have read everything I can think of and tried I think everything .. need ideas what can I try the router is a Dlink 634 I assume since the other computer can log in as a client that router can be ruled out except.. the win98 machine is wireless where the other two are hard wired..

frustrated as this same hardware worked great before the crash

thanks very much for ideas..

Dan
