Hello,

try and use the "Do not use authentication" option in the Advanced Tab sheet of option. This does not persist however so if you want to make it permanent add following line to the default.rdp file (or any other saved .rdp file):enablecredsspssupport:i:0

That will take care of it. Cheers

I just installed TSC 6.0 on my WinXP Pro and WinXP MCE systems. I use the MCE system to connect to the Pro system via RDP.

So far, all I've noticed in TSC 6.0 are new annoyances. For example, I have always used RDP by running the command line "mstsc.exe [file name].rdp". This always used to make the connection, and then go right to a "Log On to Windows" dialog. But with TSC 6.0, I always get a "Remote Desktop Connection" dialog first, and then still have to enter the (same) credentials again on the "Log On to Windows" dialog. What is the point to the "Remote Desktop Connection" dialog?

Also, on the "Remote Desktop Connection" dialog: Sometimes, the user name is pre-filled as simply "User". Other times, it shows up as "x.x.x.x\User", where x.x.x.x is the IP address. Still other times, it appears as "User@xxxxxxx". This last case is especially irritating, because the "User@xxxxxxx" carries over onto the "Log On to Windows" dialog, where it causes authentication failure. So, whenever this happens (which seems to be randomly, but often), I have to manually edit the user name field on the "Log On to Windows" dialog, changing it from "User@xxxxxxx" to "User". Annoying. Very.

Any info would be appreciated.
