Jose,

Since the LAN is behind a router there really is no need to use two NICs in the VPN server. Your network would then look close to this example. In this example the VPN server is Ashtabula.

<http://theillustratednetwork.mvps.org/Vista/PPTP/ExampleVistaVPNNetwork.pdf>

....with the VPN server on one desktop and the SQL server on the other desktop. In the above example the SQL server would be running on Norman. Use addresses in the 192.168.16.X range versus the 192.168.1.X range in this example.

<http://theillustratednetwork.mvps.org/Vista/PPTP/VPNSetup06.jpg>

You should be able to access the SQL server by IP or name once you connect through the VPN. You may need to use an lmhosts file on the client to map names to LAN IP addresses. Here is an example based on the above example network. You would change the addresses to the 192.168.16.X range.

Make sense?

Sorry for disturb your discussion, but I have a similar problem maybe you could help.

Re: XP Remote Desktop over VPN problem

I have a normal LAN, connected to internet and with a PC running SQL-Server express. I need to connect a external PC via VPN to the LAN. For security reasons I can not use de SQL PC as a VPN server, but maybe I could use one of the others as a VPN server and connect through it to the SQL-PC. This is the idea: the LAN is in the 192.168.16.x range, I use an internte router with the needed ports open and the VPN server PC with 2 NICs (network cards). What is the configuration method I should use? Thank you for your help.
