Cooper, Mark wrote:

Does anyone know where you can find best practices for remote connections? The reason I ask is I have over 20 users that work remotely. They use a RDP session to connect to our server through a VPN. The problem is I have several different types of connections. I have some that use wireless to their ISP, DSL, Cable, and satellite. The wireless and satellite seem to have a lot of issues staying connected.

Depending on what you mean by 'wireless' – that makes sense to me.

VPN depends somewhat on timestamps – the lag/delay such connections will experience will cause drops in the connectivity more frequently than other types of connections.

If you mean wireless to their home router which is connected to some sort of wired DSL/Cable Modem/etc... The wireless makes less sense – but I got a feeling you mean strictly wireless all the way to the home? (And Satellite even warns you that it is unlikely to work with VPN connections.)
