Early yesterday morning, I installed the following Windows Updates and I am still fighting problems since the reboot after the updates.

RE: Windows Updates

KB893756

KB896727

KB899587

KB899588

KB899591

One Windows Server 2003 Standard SP1 machine, it took 1.5 hours to get pass the "Applying computer settings..." window to the logon dialog window. From there, it took an additional 45 minutes before all of my profile was loaded into the GUI. Fortunately, during this time all users were able to connect to the server and the server is NOT an application server (only used as a file server).

I have another two Windows Server 2003 Standard servers that I service 52 network printers. After the above updates were applied, I have a couple of desktop computer that couldn't print to any of the Lexmark printers (E330n and E332n) printer, nor could anyone add these printers to their printer collection.

I also have a Windows Server 2003 SP1 server with Veritas BENT 10.0 backup software that have multiple backup job errors from last night's backups (AFTER I UNINSTALLED THE UPDATES AND REBOOTED) and I also had to reformat one of my SDLT tapes.

Even after uninstalling ALL the latest Windows Updates on one of the servers that maintains printers, I still have problems installing the above network printers (tried on WinXP Pro and Win2K Pro with the same results (no printer driver was installed & when I try printing to the printer I get a "printer error". This is true on ONLY THE LEXMARK PRINTERS). I have tried using Lexmark's latest Windows Certified (digitally signed) drivers with the same results.

My question is this, "What in Sam's Hill is going on!" I have used Windows server products since NT 4.0 Server in 1996 and I have never encountered this

## Multiple issues (Server & Desktop) since last Windows Updates

severe a problem with installing Updates.

—  
Thank you,  
Mark
