I have a Windows 2003 SBS Server and a user on a Windows XP SP2 system that have mapped drives that say 'Disconnected Network Drives' when you look through Explorer. If you do Tool, Disconnect mapped drives it says there are non mapped. If you go to the DOS prompt and do NET USE \* /D is says no drives mapped. If you click on these disconnected drives it connects to shares on the server but does not ever change the description of the mapped drives. Just says 'Disconnected Network Drives'. Tried to right-click mapped drive and disconnect and it says ' Network Drive not found'.

I have rebooted Server and PC but still have the mapped drives. Not running any GPO or netlogon scripts...Even tried logging on as another user but still there!

Does anyone have a fix for this? Is there a registry hack.....

Thanks

Phil
