If I have read your post correctly, yes, this can be done provided that you want to control precisely the membership of the Administrators group on the machines within the scope of the GPO that you use. That is to say, you will need to state exactly what should be in Administrators, and then that is how it will be, with the only way to change it being changing the GPO or taking the machine out from the scope of the GPO. If this fits, then you should look into using Restricted Groups to define the local Administrators group membership, using an GPO that is linked to an OU
