Microsoft Corporation,

I wrote this because I hope that the corporate officers of Microsoft will hear of the complaint. So PLease do not remove it...move it upstream to them if anything.

I am currently learning about Microsoft Windows protocols and applications regarding the securing of Windows XP Pro and Windows Server 2003. I have just concluded attending the Microsoft Security Summit and an additional class through New Horizons here in Chicago, Illinois regarding group and security policy administration. That is what piqued my interest in the available applications.

Last night through the Microsoft Corporate website, a site I trusted to be able to obtain documention from considering that I might use documentation that was not accurate from elsewhere I attempted to find the ability for batch or script group and local security policies. It was at that time that I began being severely hacked by what appently looks like none other than Microsoft Corporate system administrators. Most if not all of what was hitting my system was through microsoft.com. Can you explain what I have just said?

I admit thaat I looked at well over 100 to 150 documents and was on the Microsoft domain for well over four hours but that is how long it took to find what I was looking for. Your document base is not properly stemmed nor is it set up for system administrators who are migrating from entry level to advanced administrators. In order to become an advanved user of your online systems it probably takes any individual well over a year given the services and document base that you have. This is not going to happen overnight. I absolutely could not find what I was looking for and that is why I had to continuously run searches and pour through as many documents as I had. I have better things to do woth my time such as performing the actual systems security.

I did eventually see the "Threats and Countermeasures Guide," which is part of the information that I sought. I still have not download

microsoft.public.windows.group_policy: Hacked via Microsoft Servers!

"Windows XP Professional Resource Kit" or "Windows Server 2003 Resource Kit Tools" because I was under some very heavy fire. Nice hack on instanciating the WMI and Print Spooler services though I do not know what you were up to. It certainly pisses me off.

Now, I've been more than polite, but I would say that if you think you are going to beat Google at indexing any documentation that you had better start with a consolidation of your own documentation on your own hosted systems, consider better stemming mechanisms for your database systems and stop hacking individuals looking for documentation regarding support until you develop better mechanisms to find the documents that you have.

That is about all I can say, because if I say much more I think we will both lose respect for each other. I would tone down your server security team and any other anuses hanging around that think that they own the world.
