I like Mark are confused at how you are trying to do this. Are you attempting to set this is a GPO of AD that is applied onto the server, or to do this in the member's Local Security Policy ? If via AD GPO you are using a GPO linked to an OU (containing the servers) not to the domain (right?) and are entering Administrators rather than selecting it with the GUI? Also, are your members W2k or W2k3 ? With W2k3 you can use the policy to disable the Administrator account to make the built-in Administrator (however renamed) only of use for a non-normal boot (recovery, safe mode, ...). Also, if you have TS installed in admin mode on W2k, or you have W2k3, you would want to remember to also take control over use of a TS login by the account(s).
