I don't know if it is documented anywhere.

I know this from experience.

If you look at your default domain controller policy, in the user rights assignments section, you will see the setting exchange domain prep modified.

It is the "managing audit and security log" user right.

restoring the domain controller policy will take this setting back to defaults.

Now that you know the setting, you could just add the group back instead of having domainprep do it.

Infact, you should write all the settings down (or take screen shots) under user rights assignments and security options sections before you restore.

There may be other settings unique to your environment.
