Hi Carl O,

Sorry Carl, my mistake for not add any comments in code.

Assume the follwing cenario:

Domain name = XPTO

Domain Global Security Group = ITTechnicians

Purpose = add ITTechnicians Domain Group to Administrators Local Group

```
'-----  
Set wshNetwork = CreateObject("WScript.Network")  
ComputerName= wshNetwork.ComputerName  
  
localstr="WinNT://" & Computername  
  
'Get domain group and assigned to ITTechs Variable  
ITTechs="WinNT://XPTO/ITTechnicians"  
  
'Add Domain Group to Administrators Local Group  
AddToGroup ITTechs, "Administrators"  
  
Function AddToGroup(member, Grpname)  
  
Dim grp1  
Set grp1 = Getobject(localstr&"/"& Grpname,group)  
grp1.Add (member)  
  
End Function  
'-----
```

Please let me know if you have some questions.

Regards,

.
