Desktop Standard offers a piece of their group policy management software for free – the Registry Extension tool.

You can download it here:

<http://www.desktopstandard.com/PolicyMakerRegistryExtension.aspx>

Install on your machine and then you'll have a regpol.msi file in the install folder that can be used to deploy the new client-side extension to your clients. With that in place, you can use the new settings available in the GP editor to manage the registry.
