Check the logs in Event Viewer to see if any pertinent errors are recorded and run the support tools netdiag, dcdiag, and gpoutil on your domain controller to see what they report. More than likely you will find something that will give you a clue. If you find any specific Event ID's that you want further information on try searching Google web and groups and use <http://www.eventid.net> to find further info. Offhand it sounds like it may be a problem with the sysvol share or permissions to the sysvol folder structure. --- Steve
