It might help if you can post the whole Event ID. The link below is to a KB article on troubleshooting Event ID 1202 which may be a good place to start.

<http://support.microsoft.com/default.aspx?scid=kb:en-us:324383>

The link below is to user comments on Event ID 1085.

<http://www.eventid.net/display.asp?eventid=1085&eventno=1412&source=Userenv&phase=1>

The settings you mention for kerberos policy apply only to domain controllers. Group Policy problems are often caused by dns misconfiguration or otherwise inability of a domain computer to find or contact a domain controller. Use the support tools netdiag, dcdiag, and gpoutil on your domain controllers to check for health and proper configuration and use netdiag and gpresult on domain computers. If everything checks out OK and everything else works correctly including Group Policy it could be one of those quirks of sometimes seeing unexplained Event ID's [which seem to happen most with XP computers in W2K domains] yet everything works fine that will mostly be an annoyance in the logs. --- Steve
