I was referring to the last section of the maint/adv group as it appears in the IE Options windows. The 'Security' block at the bottom has about 16 choices in the IE dialog box, but only 2 GP settings in the GP Editor. The full maint/adv page has more, yes.

I imported wuau.adm to get all my firewall settings and WSUS stuff (can't remember which) a while back and that worked nicely. I guess I am looking for a bit more in the way of IE settings that I can push via domain group policy.

The IEAK stuff seems vastly overkill for what I'm trying to do – we don't 'deploy' IE, its just installed on our workstations and I can't get past the part where it wants to do a bunch of stuff to our IE Deployment environemnt – because we don't have one.

I don't really want to have to wade throuhg 300+ registry change deployments, either. I've been able to do all the settings I've needed up to this point in the group policy stuff and I'd really like to stick with that way of doung things – I just need more templates (or options within the templates or whatever).

Makse sense?
