Yes I see your point. In my case the runonce process will create a per user logfile when it successfully completes and I can then move them up the ou tree a notch where the runonce GPO doesn't apply. Well, that's the plan anyway. Logging is working, GPO is working. Now when I get the program to work I should be set.

Hi,

kj schrieb:

What's the best way to do a user runonce setting (XP,2K)? Custom adm maybe?

None ... because if you define a GPO/Policy with the runonce key, you have the problem, that your command is always processed, at time the GPO is applied again.

So that's why it will never be "runonce", it will be the same as the "run" entry.

The trick on "runonce" is, that the entry is deleted, after process. But you define this setting again and again and again ...

Mark
