I will check tomorrow, the DC is at a remote site (near to where we are based in the UK) that links via VPN to the domain based in Austria. Dont know if that makes a difference at all. I'll let you know what I find on the SYSVOL directories, cheers.

"Darren Mar-Elia (MVP)" wrote:

Ok. So the DC itself cannot process GP and gets binding errors? Yikes. That doesn't sound good. If the DC can't bind to itself that sounds bad. Are you getting any other errors in the AD log or System log? Have you checked that SYSVOL is properly shared on that DC? If you look under SYSVOL\<domain>\policies, do you see a bunch of guid-named folders?

When you say "the client" I dont understand as these errors are happening on one of the DCs and not on any clients as far as I know. I think in the 1006 event it says windows could not bind to the domain.

Thanks,
Chris

Chris-
The "manage passwords" thing sounds a bit spurious, if you ask me.
Anyway,
there are probably several things that could cause this, including
firewall
between client and DC, improper DNS config on the client, invalid machine
account on client. What is the error message in the 1006 event?

Darren

Hi All,

On one of our DCs we are constantly getting these errors in the event log saying that windows cannot query for GP updates or bidn to the domain. I have read other posts about this and have researched it and the thing that seems

Re: Userenv 1030 + 1006

to fix everyones problem is to remove
cached credentials from the
"manage
passwords" section of control panel. I have
done this and the server
has
been
rebooted but we still get the errors. Anyone
think of anything else to
try?

Thanks,
Chris
