– load the ADM, configure it

Sorry for beeing impertinent, but I would like to get this issue clarified.

First, couldn't you just as well use the "built in" policy, setting 177 on the "Security Settings WinXP; WS2003" –tab in the GP

Reference:

<http://www.microsoft.com/downloads/details.aspx?FamilyID=7821C32F-DA15-438D-8E48-45915CD2BC14&disp>

I.E:

MMC -> Computer Configuration

-> Windows Settings -> Security Settings

-> Local Policies -> Security Options

-> "Network Access: Sharing and security model for local accounts"

-> "Classic – local users authenticate as themselves"

This is the same registry setting as in your .adm–file.

??

– create a OU and link the GPO to it

Second, the Reference says:

"Important: This setting only affects computers running Windows XP Professional which are not joined to a domain."

AFAICS it should not matter if you use an .adm–file you made yourself, or the built in setting since contains the same registry setting.

This seems to be a LGPO only setting.
