Read the following article:

How to apply local policies to all users except administrators in a workgroup setting in Windows 2000

<http://support.microsoft.com/?id=293655>

Well, this article tell me to do what I've been doing -- basically changing the policies on a user by use basis, by logging in as that user. Here's a quote from the KB article:

6. Log off from the computer, and then log on to the computer as one of the non-administrator users of this computer for whom you want these policies to apply. Repeat this step for each user of this computer for whom you want these policies to apply. The policies are implemented for all these users and for the administrator.

This is what I was trying to avoid. I would rather just change the policies for a user while I am logged on as the administrator.

Thanks for the reference to the article. I appreciate your reply.
