Hi!

Is it possible that your administrator account is not in OU to which your GPO is linked? GPO applies only to users (user configuration part) or computers (computer configuration part) in OU with GPO linked.

Toni

I'm wondering one thing for Windows 2003 server. For instance, I have configured one group policy for hide all the desktop item for users in an OU.

If I run gpresult in server with administrator account. The policy what I have configured not shown in "Applied Group Policy Objects". However if I logon the server with that OU user account and run gpupdate. The policy what

I have configured will show in "Applied Group Policy Objects". So I would like to know, the group policy what I have configured can be apply to user or

not? Do you think this is a proper setting?

"Roger Abell [MVP]" wrote:

There are policy settings added with each Windows release, and newer ones are ignored by earlier versions of Windows. So, it depends on what you are applying and how. If you are settings Windows 2003 vintage settings, then these will not have any effect when it is a Windows XP machine. You need to be more precise if you wish a precise response.

Re: Why Win 2003 group policy can not apply to client

Hi!

I'm using Win 2003 Server. I have configured some group policy in certain

OU. However when user in that OU log in to Win 2003 domain. The group policy

that what I configured in the OU can not applied to workstation.

However

when

I try to login the account use server itself, the group policy can

applied

to

server itself. So I do not what's wrong for the group configuration for

this

case. So any one got the idea?

Regards
