I have a group policy on top of OU finance for drive mapping and setting default printer but few users have default printer different from defined at OU level, hence I have attached user profile login script for those users but the nightmare is both of the scripts executes same time and group policy login script undo the changes of user profile login script.

And at the same time i dont want to seperate those users from OU as they all belong to the same OU finance, is there anyway I can let wait user login script wait until group policy login script finish ??????????

I have already activated "Run Scripts Synchronsly"

I was thinking that the hierachy would be like following :

- 1) Group Policy login script
- 2) User profile login script
- 3) Explorer

but user login script running first thus they are again getting assigned the same printer like others.

I don't see a way to control it !!!!!!!

Adnank5,

This is a very common problem for most admins, login scripts get out of control, and then windows limits what you can and want to do. There

is an application that is used by a lot of companies to help you accomplish this, It is Desktop Authority from scriptlogic. It will

Re: Group policy login script and user profile login script

allow you to process settings for users how you want in a very granular level.

Here is the address:

<http://www.scriptlogic.com/products/desktopauthority/>

I hope this was a help.
