Howdie!

Go create another OU and put the computer account(s) into that. Create and link a new Group Policy there and make your computer configuration settings in that GP.

- oh i see now, i get your point.....why i didnt think of that :)
- but now i have another problems...i did wat you suggested created a new OU

[quoted text clipped – 4 lines]

concern is that is it ok if move the computer account to the OU which i just created.

I'm afraid but I don't get your problem, I think. What did you do? Add the computer from where you want to log in into the newly created OU? Logging afterwards in and received an error message?

Of course is it okay to "Move" the computer's Active Directory account into that newly created OU to which you linked your policy – otherwise the computer wouldn't pick up the policy settings again.

cheers,

Florian

– well its like this im adding a new computer which according to the error it is already existing

Re: GPO Settings not applying

– also is there a way i can check if all the settings i placed in the computer settings or in the user settings is being applied. i configure the account lockout policy to lockout 3 failed login attempts. it tried to login 6 times in the domain with wrong user name and password but it didn't lockout.
