thanks for the reply. then net command, using a batch file, set as a logon/loggoff script is the route i choose and it is working perfectly. Thanks.

There are a few different ways to handle this. One way may be to add a GPO based logon script. Using a conditional (if/then for group membership), you could run the following command:

```
net.exe localgroup administrators "Your.Domain.Name\Domain Admins" /add
```

Keep in mind this is a shell command and would need to be ran from a .cmd or .bat file. There are several examples out there to accomplish this via VBScripting as well.

Take a look at the following sites for examples:

<http://www.microsoft.com/technet/scriptcenter/default.mspx>

<http://msdn.microsoft.com/library/default.asp?url=/library/en-us/script56/html/vbscripttoc.asp>

<http://www.scriptinganswers.com/>

<http://cwashingon.netreach.net/main/default.asp?topic=news>

Desktop Authority could also handle this for you, www.scriptlogic.com/da. The "Application Launcher" Object could process the command I referenced above with Admin Rights at Logon, Logoff and a Refresh interval. the Refresh interval would ensure the group membership was correct throughout the day.

Best,

I want to add/force my domain administrators group to all machines in my domain via group policy without disruption of service and without changing any current members.

Some of my local administrators have removed the domain administrators accounts from the local groups and i want to put the domain admins back in.

If i use the standard GPO it replaces memberships, i just want to add the domain admins.
