I am with G Johansson on this.

I at times see machines using unexpected firewall policy, and have since taken to defining the remote admin exception in both firewall policies. You can use netsh firewall context to find out which policy is in use.

Either that or AD based group policy is not being successfully applied to these machines at all.

As a matter of fact I tried the portqry and this is very peculiar since I found in some instances that nor group policy or "netsh" command did any help

<http://technet2.microsoft.com/windowsserver/en/library/b8057a7a-a0d3-40b5-8224-ea6a4f5e17231033.msp>

Is it possible for users to configure the firewall to dismiss policy-settings?

"Darren Mar-Elia" wrote:

You can also use the portqry.exe utility (MS download site) to query the remote system to make sure you can get through on the ports used by WMI, like 135 and 445.

In any case you would need to go to the computer but on the first page make sure that the firewall settings is using the domain profile and not the standard profile (if you have only changed in one of course). You can always open the firewall and check if your settings has been applied or not...

Thats my best guesses how to solve it...

Hello, I have an inventory WMI scanning program and in order to enable scanning of clients with enabled firewalls I have set the domain level policy to allow remote administration in the group policy for Windows firewall. However, I have noticed that the scanning cannot detect certain computers with the firewall enabled so how can I troubleshoot that this firewall exception policy has indeed propagated to the client?
