I want to install the content of a .exe file from a normal user account using command prompt which do not have administrative priviledges. help out urgently.

Although this isn't the proper forum for this question, I'll try.

Use the command prompt command "runas" to open another command prompt using the credentials of an account that does have install privs. Install from there.

For example..

```
C:\> runas /user:domain\adminuser cmd
```

This will prompt for the password for the adminuser account, and then open another command prompt with those credentials. You can then execute your install program or script from there.
