Mike-

How did it screw up WMI? Sounds like a DCOM security setting---that will do it every time.

Thanx Darren! The other GPO clean up script will come in handy also - I have somehow made a GPO setting that screws up WMI and none of the experts I have shown the GPO to can figure out what part if it doing it!

Mark is a comedian :)

You can use GPMC scripts to do this or if you are PowerShell inclined, you can use my free GPMC cmdlets quite easily. Specifically:

get-SDMgpo * will return a list of all GPOs in the domain, including names. You can even use PowerShell to output that list to a text file and then use it as input for the new-SDMgpo cmdlet to create them in the new domain.

We are merging into another domain, and I need to give them a list of my GPO names so they can pre-create empty GPO for us to import our settings into.

Thanks for sharing this interesting und usefull information.
