Hello SoyLentGreen,

What did you add on which field to the user properties? Please post an unedited ipconfig /all from the DC/DNS and the machine.

Best regards

Meinolf Weber

It is just a simple vbs script to mount a drive, here it is:

```
'  
' MainLogon.vbs  
'  
' Variables Declared  
'  
Option Explicit  
'  
Dim objNetwork, objShell  
Dim CheckDrive, AlreadyConnected, intCounter  
Dim strDrvLetter_R, strRemotePath_R  
Dim strDrvLetter_S, strRemotePath_S  
Dim strDrvLetter_T, strRemotePath_T  
Dim strDrvLetter_F, strRemotePath_F  
Dim strDrvLetter_M, strRemotePath_M  
'  
' Set the Variables  
'  
strDrvLetter_R = "R:"  
strDrvLetter_S = "S:"  
strDrvLetter_T = "T:"  
strDrvLetter_F = "F:"  
strDrvLetter_M = "M:"
```

Re: AD GPO Cannot run logon script

```
,  
strRemotePath_R = "\\psw-900700\PSWPolicies"  
strRemotePath_S = "\\psw-900700\PSWShared"  
strRemotePath_T = "\\psw-900700\PSWData"  
strRemotePath_F = "\\psw-900700\Accounting\FundAccounting"  
strRemotePath_M = "\\psw-900700\Accounting\mas90"  
,  
Set objShell = CreateObject("WScript.Shell")  
Set objNetwork = CreateObject("WScript.Network")  
Set CheckDrive = objNetwork.EnumNetworkDrives()  
,  
' Check to see if the R: Drive is mapped.  
,  
On Error Resume Next  
AlreadyConnected = False  
For intCounter = 0 To CheckDrive.Count - 1 Step 2  
If CheckDrive.Item(intCounter) = strDrvLetter_R Then AlreadyConnected  
= True  
Next  
,  
If AlreadyConnected = True Then  
objNetwork.RemoveNetworkDrive strDrvLetter_R  
objNetwork.MapNetworkDrive strDrvLetter_R, strRemotePath_R  
objShell.Popup "Drive" & strDrvLetter_R & "Disconnected, then  
connected  
successfully."  
,  
Else  
objNetwork.MapNetworkDrive strDrvLetter_R, strRemotePath_R  
objShell.Popup "Drive" & strDrvLetter_R & "Connected successfully."  
End If  
,  
,  
' End of the line...  
,  
WScript.Quit  
,
```

I can run this script from the local XP system and it runs just fine.

I have put the script in the c:\windows\SYSTEM32\scripts directory.

It also shows up in the \\(server)\netlogon directory.

I also setup the user properties to run the script and it does not.

Hello SoyLentGreen,

Re: AD GPO Cannot run logon script

You can not link policies to the user/computer containers. You have to link policies to OU's.

You should better design you AD structure for your needs and add OU's for machines and users. This will help you getting a better overview. If you leave anything at the default location you can/will also link policies to accounts/machines where you don't like to have them, also configure your own policies and leave the default ones on there location and do not modify them, if you have to rollback because of errors or policies are screwed up, you can easily go back to the default state.

Please post the content of the login script. What kind of script do you run, .vbs .bat .cmd? If you link a policy to an OU for the user or the computer you will see the policy also in the gpresult output, either after a reboot or running gpupdate /force on the client. Additional you can wait up to 90 minutes for autorefresh of the policy.

Best regards

I am trying to setup a new server w/AD. I DO NOT have OU's and all the users are in Users, there are just a few users. The script runs just fine, I have tried it on the local XP workstation, so there is no problem with the script.

I put the logon script in the default policy in the users logon. Does not work!;(

I put it in the user properties. Does not work!;(

I created a new GPO assigned it to Domian Users. Does Not Work!;(

The script is in the proper location(s).

I have to be missing something, besides pulling my hair out.

Here is the gpreults from a test workstation:

Microsoft (R) Windows (R) XP Operating System Group
