Hello Asif,

Congrat's. Nice to hear that you got it running.

Best regards

Meinolf Weber

Holy Diggleberries!!!

That did it. I removed the one I had there and clicked Add, browse and selected the conflicker.bat file, applies and ok'ed out of everything.

Did a

gpupdate on ther server and machine, restarted the machine and it started

showing "Running Startup Scripts", and now it shows its installed.

Awesome.

Thank you so much Meinolf for your help.

"Meinolf Weber [MVP-DS]" wrote:

Hello Asif,

Just to make sure, the script name is the patchfile name? Choose Add and do not type "patch", click the browse button and then use the batch file which contains the commands.

If you install the patch from the policy location it works?

Open

\\domain.com\SysVol\domain.com\Policies\{3F30361D-1A8A-4B3F-xxxx-xxxx  
xxxx}\Machine\Scripts\Startup\ from the run line and doubleclick the  
batch file.

Meinolf,

Any ideas???

I changed my setup to match yours. Only thing that is different is

the name

of my script – I go in to the OU, edit the GPO, Startup scripts and called

the script name "Patch". I click "Show Files" and there I see conflicker.bat

(which contains the statements you mention in your last post), the

KB

exe,

and the empty KB txt file.

I did gpresult on the PCs and the GPO is showing up now.

Not sure

why

but it

took a week on this particular PC. I moved another PC to the OU and

it

showed

up during next reboot.

However, the patch is not installing on any computer. I

rebooted

couple of

times and did gpupdate both on the server and computers.

Let me know

what you

think. Thanks.

"Asif Shah" wrote:

Meinolf,

I think I see what might be the problem.

When I go to my OU and open the GPO, I

then go to Computer

Configuration –

Windows Settings – Startup, double click on

Re: Install Windows Patch via GPO

it and I see the path

to

the .cmd

file that has the command that runs the .exe:

Path to cmd file:

\\servername\NETLOGON\patch.cmd

Command in cmd file:

\\servername\public\z\_WindowsXP-KB958644-x86-ENU.exe

/quite

I think I have to put either the .exe in the

path that comes up

when

you hit Browse when you want to add a new

script (which is what you

have) or put the cmd file there. The path that

comes up when you

hit

Browse is:

\\domain.com\SysVol\domain.com\Policies\{3F30361D-1A8A-4B3F-xxxx-xx

xx

xxxx}\Machine\Scripts\Startup\

Is this correct? What should I put there, the

exe or the cmd?

"Meinolf Weber [MVP-DS]" wrote:

Hello Asif,

I am running out of ideas, i

will describe the way i did it

in my

domains, a bit different, but

also your way should work

if the

configuration is as you

described it. Here is my

way:

I use a startup script,

including this in a GPO:

-----  
--  
-----

;install

KB958644(Conficker

worm) in silent mode and

creates

logfile to prevent

Re: Install Windows Patch via GPO

loop on install

if not exist

%systemroot%\W2KKB958644.log

\\domain.com\SysVol\domain.com\Policies\{3F30361D-1A8A-4B3F-xxxx-

xx

xxxxx}\Machine\Scripts\Startup\W2KKB958644.exe

/quiet

if not exist

%systemroot%\W2KKB958644.log

copy

\\domain.com\SysVol\domain.com\Policies\{3F30361D-1A8A-4B3F-xxxx-

xx

xxxxx}\Machine\Scripts\Startup\W2KKB958644.txt

%systemroot%\W2KKB958644.log

/y

-----  
--  
-----

The .txt file is empty, just a placeholder on the disk for skipping the patch at next reboot.

So if you use "Show files" in the startup properties of the GPO

under computer

configuration, there are 3

files located:

- conficker.bat

- patchfile

W2KKB958644.exe (file

name is shortend)

- empty W2KKB958644.txt

file
