Unless the web page you are viewing is coded to open up a new window if you click on a link, then the new contents will always overwrite the existing page on display. If you want to ensure that a new window is activated whenever you click a link, then do so while holding down the SHIFT key. That will force the page to be displayed in a new window.

There is a setting in IE under Tools/Internet Options/Advanced tab which has a tick box against "Reuse windows for launching shortcuts", which should not be ticked. But that is more for internet aware programs like Outlook Express so that if a link is clicked there, if IE is already open then it will use this window instead of starting a new session of IE. If you want a new window of IE from an OE link, then tick the box. Probably now really what you want. It does not seem to affect IE itself.

Hope this helps,  
Martin
