I frequently get an error report that states "Internet explorer has encountered a problem & needs to shut down". The reason for this problem is with the application name iexplore.exe, version 6.0.2800.1106 modified name wzhelper.dll, mod version 2.0.0.0 offset 00066d90. This wzhelper.dll is in my system32 hidden folder; it was created November 2003. It's a browser helper and I need to know how to get rid of it. Not sure if this was an update or what, but it is what is causing my computer to shut down frequently. Any input is greatly appreciated.
