Several of these are known to cause problems:

1) Zone Alarm Pro [Private Header Info – enabled?]

Reset "Ad Blocking" and "Cookie Control" to "medium"

"Mobile Code Control" = Off

2) Symantec (ISS\NIS)[Enable Browser Privacy – enabled]

Active Content – "Allow All Script To Execute"

Problem: some sites cannot detect the 128 bit encryption

Solution: Completely remove and reinstall NIS.

3) Any "ad blocking" software that blocks "http_referer"

or contains entries that are blocking access to the desired site.

4) HOSTS file that contains entries that are blocking access to the desired site.

5) Cookie blocking software that are blocking "required" Cookies.

6) Pop-up blockers that are stripping header\url info.

7) WebWasher Standard Filter/URL Filter

8) Make sure the following entry is not corrupt:

[HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Internet Settings]

"User Agent"="Mozilla/4.0 (compatible; MSIE 6.0; Win32)"

Note: "Win32" = Windows 98\ME

Other versions = (compatible; MSIE 6.0; Windows NT 5.0;)
