Thanx to all, but it still won't work on this new power house computer and it really ticks me off... You would think this new computer would open ANYTHING... Everything else on it works perfect but that one web page... OH WELL... I am beginning to wonder if there was something wrong with the java files that I downloaded from third party.. Strange you say Sun Java 1.4.2_03 would open it.. It wouldn't open ANY of my java applets on the rest of my site... Soooo, I uninstalled it or would it make a difference if I had the 1.4.3_04... I understand that that is now available, but am afraid to d/l it and have it not work. I haven't had much luck with Sun Java at all on any of my computers. I have 3 running on a network and the other two are OLD computers and they open that page just fine running the MS JVM . OH WELL again, maybe I just learn to live with it.
