One night I was online, when I went to bring up IE 6 and the page came up as the standard 404 error, page can not be found. I thought it might be my computer so I rebooted, and still the same thing. At the same time, my dad's computer experienced the same problem. (We have two computers, networked, on a Cable connection) We called the cable company the next day and they sent a tech out. He discovered that the cable had accidentally been cut by some contractors we had out at our house removing trees. So he ran a new wire (although he did not bury it) and left. My dad's computer was able to immediately go online and function as normal. However mine, was a different story. I tried accessing the internet and it would not work, again, same error message. However I know my computer is seeing the network because it can see the network and print pages to the printer upstairs successfully. I think I might have a virus that has corrupted my IE settings. We ran EX Trust Anti Virus, and lavasoft Ad Aware 6, with no positive results. Any help is GREATLY appreciated.

thanks

Anthony
