I asked about this last week, but no one seemed to have a response ... thought i'd ask again, since it's a real drag not to be able to access my webmail (Opera and Netscape don't actually interface well with the Exchange server webmail).

My company uses exchange server 2003 and has webmail enabled; however, I can't get the authentication pop up to show up and end up getting the access denied page.

I have done all the settings I can think of including clearing the cache, cookies, history; setting the look for newer versions to "never"; turning off all firewall settings; no popup blockers are enabled.

I'm on a win2000 box with IE 6.0.2800 and 128 bit encryption.

I can telnet the site to verify i can get to it. I can get to it from work (but that's inside the company firewall) and others can get to it from outside the network (over the internet, that is).

any help would be appreciated!
