Because safe mode inhibits some programs from loading. Figure out which programs aren't loading then manually inhibit or allow them selectively (e.g. using msconfig) and see if you can avoid your symptom. E.g. if there is only one program which is causing the problem removing it could be the solution.

<title>KB316434 – HOW TO: Perform Advanced Clean-Boot Troubleshooting in Windows XP</title>

Notice all the links to related articles at the bottom of that document.

Tip: if you have a lot of programs which you want to test and your assumption is that there may be only one which is causing the problem you can cut your testing time by cutting the set of inhibited programs in half each time. E.g. that way in a set of 16 programs you could guarantee that you could find a problem one in 4 tests instead of a potential worst case of 16 tests (and average of 8) just doing sequential testing. Etc.

FWIW I don't have the Sun VM and the applet seems to load for me. The .cab file for the Java stuff doesn't expire and is cacheable so it may help for you to try to refresh with Ctrl-F5. If the Last modified: is correct that seems unlikely to be changed, (e.g. I see 2001-02-20 13:28 for it) but yours could be corrupt. Of course the other way to avoid that possibility would be to clear your TIF. I'm not sure how I would explain how this possibility would be related to your observation about being able to use the site in safe mode. (I have some ideas but they are really just

uninformed speculation.)

Good luck
