isearch has hijacked my IE 6.0. in following your instructions, i found hosts 3 times:

\i386

windows\system32\drivers\etc as a file

windows\system32\drivers\etc as a icalender file

- a) do i rename both of the drivers files initially?
- b) do i eventually rename the original hosts back to hosts?
- c) would deleting the one "host" file work?
- d) any idea why norton wouldn't catch this when my last update was just two weeks ago?
