Did you install a firewall when you got the new router?

You may have already been hacked.

Try this: Tools > Internet Options > Advanced > Browsing
Uncheck the Enable 3rd party browser extensions

If this clears your problem then find out who the culprit(s) is/are with these tools.

Let AD-Aware Scan your system for advertising Spyware

<http://www.lavasoftusa.com>

If you use a HOSTS file, beware of this new issue.

Ad-Aware has decided to include a new detection when scanning the HOSTS file. This now creates a "Bad hosts file entry" in the log file generated at the end of a scan. The best thing to do is to place a check in each entry, right-click and select: "Add selection to ignorelist". Otherwise if you let AWW "fix" these items it will trash the HOSTS file! Even if you have it "locked" by [example] SpywareBlaster or Winpatrol. It does not return the attributes and renames the HOSTS file incorrectly to hosts.

and:

SpyBot-S&D

<http://security.kolla.de/>

p.s Reset the 3rd party browser setting.

More: This may be caused by a third-party program (adware, spyware, parasite).

Get AdAware and SpyBot and run them both. Keep them up to date.

Dealing with Unwanted Spyware, Parasites, Toolbars and Search Engines

IMPORTANT:

Before trying to remove spyware, download a copy of LSPFIX from the URL below – some malware may kill your internet connection when it is removed, this program will enable you to regain your connection.

<http://www.cexx.org/lspfix.htm>

<http://www.spychecker.com/program/winsockxpfix.html> (if your OS is Win2k or XP)

Important: "So how did I get infected in the first place?"
