Every time I browse to a page that has a applet the java console launches. I have SDK 1.4 on my system. The problem is that it launches a new IEXPLORER each time a new applet is visited. I have to use CTL_ALT_DEL to clear them all out.

Why is this happening and what so I need to do to stop this? The console won't let me shut it down or hide it from the clock icon bar either.

Please email me with a response and your help will be really appreciated.

Thanks...
