After a fresh reboot I can access websites and my mail server using outlook express, everything works fine. However, after about 10 minutes websites start to load slower, pictures don't load, and I can no longer access my mail server. A few minutes later I can no longer access websites at all. A reboot solves this problem. I have cleared my internet temp files, reset all of my web settings to default, used the handy repair tool in my network settings. All to no avail. No other computer on my network has this problem. I have also run sfc /scannow, deleted the temp internet folder and cookies folder.

When my connection goes sour I still get an IP from my DHCP server, can still ping out to websites, and can still Remote Desktop in through my firewall. I also believe that if I use a download manager while the connection is sour I still get great bandwidth. The download could have a delayed start though. I am not 100% sure of that. I have not added any new software nor have any settings changed (besides resetting the web settings) to the best of my knowledge. Anybody have any idea what is going on?

Don, I have tried all previous recommendations with no success. The only solution I have found so far is to reboot.
