Hi to all,

short issue description:

The IE breaks loading/rendering a html page, when a embedded flash movie call a javascript function (in the same html page).

infos for reproducing this isse:

1. make a simple flash movie with following actionscript code:
getURL("javascript:CallMe()");

notice:

this actionscript function calls a javascript function named "CallMe()" in the "parent" html page:

2. take the published html page from macromedia flash, wich embed the flash movie with a object tag.

3. edit the html page and insert following sample javascript code in the header of the html site:

```
<script language="JavaScript">
<!--
    function CallMe()
    {
        // do nothing or some sensless things, e.g.
        window.open("http://www.google.de", "_blank");
    }
    // -->
</script>
```

4. insert some images into the HTML Site.

(like ``)

5. Test it in IE and in e.g. Mozilla/Firefox/Netscape

microsoft.public.windows.inetexplorer.ie6.browser: Bug in IE 6

behaviour in IE:

The IE stops loading the images in html page, when the call is coming from the flash movie.

behaviour in Mozilla/Firefox/Netscape:

Everthing O.K. !

additional notices:

- in my example you will see a new opened window with google, thats the result of the javascript function
- With dial up connection you will not see any images in the html page, because the flash movie is faster than loading one of the images.
- local the issue does not occur, because all images are loading done, before the flash movie calls the javacript function

IMPORTANT:

we are not the first, that noticed this issue:
